## Interest Rate Risk in the Banking Book (IRRBB)

Qualitative Disclosures																																													
a)	<p>The general qualitative disclosure requirement including the nature of IRRBB and key assumptions regarding loan prepayments and behavior of non-maturity deposits, and frequency of IRRBB measurement.</p> <p>Interest rate risk is the potential impact on the Bank's earnings (Net Interest Income-NII) and net asset values due to changes in market interest rates. Interest rate risk arises when the Bank's principal and interest cash flows (including final maturities), for both On and Off-balance sheet exposures, have mismatched re-pricing dates. The amount at risk is a function of the magnitude and direction of interest rate changes and the size and maturity structure of the mismatch position. The portfolio of assets and liabilities in the banking book sensitive to interest rate changes is the element of interest rate risk.</p> <p>The immediate impact of changes in interest rates is on the Bank's net interest income (difference between interest income accrued on rate sensitive asset portfolio and interest expenses accrued on rate sensitive liability portfolio) for particular period of time, while the long term impact is on the Bank's net worth since the economic value of the Bank's assets, liabilities and off-balance sheet exposures are affected.</p> <p><b>Key assumptions on loan prepayments and behavior of non-maturity deposits:</b></p> <ul style="list-style-type: none"> <li>a) loans with defined contractual maturity are re-priced in the respective time buckets in which it falls as per the loan repayment schedule;</li> <li>b) loans without defined contractual maturity are segregated into different time buckets based on the past trend, seasonality, geographical perspective and re-priced accordingly;</li> <li>c) Non-maturity deposits namely current, saving deposits are segregated into different time buckets on the basis of past trend of withdrawal, seasonality, religious festivals, geographical perspective and re-priced accordingly. However, the behavior of withdrawal of non-maturity deposits of DBBL is more or less stable.</li> </ul> <p>DBBL measures the IRRBB as per the regulatory guidelines on a quarterly rest.</p>

## Operational risk (Continued)

	<p>v) Approaches for calculating capital charge for operational risk</p>	<p>The Bank follows the Basic Indicator Approach (BIA) in terms of BRPD Circular No. 35 dated 29 December 2010 [<b>Guidelines on ‘Risk Based Capital Adequacy for Banks’ (Revised regulatory capital framework in line with Basel II)</b>]. The BIA stipulates the capital charge for operational risk is a fixed percentage, denoted by <math>\alpha</math> (alpha) of average positive annual gross income of the Bank over the past three years. It also states that if the annual gross income for any year is negative or zero, that should be excluded from both the numerator and denominator when calculating the average gross income. The capital charge for operational risk is enumerated by applying the following formula:</p> $K = [(GI_1 + GI_2 + GI_3) \alpha] / n$ <p><b>Where:</b></p> <p>K = the capital charge under the Basic Indicator Approach</p> <p>GI = only positive annual gross income over the previous three years (i.e., negative or zero gross income if any shall be excluded)</p> <p><math>\alpha</math> = 15 percent</p> <p>n = number of the previous three years for which gross income is positive.</p> <p>Besides, Gross Income (GI) is calculated as “Net Interest Income” plus “Net non-Interest Income”. The GI is also the net result of :</p> <ul style="list-style-type: none"> <li>i) Gross of any provisions;</li> <li>ii) Gross of operating expenses, including fees paid to outsourcing service providers;</li> <li>iii) Excluding realized profits/losses from the sale of securities held to maturity in the banking book;</li> <li>iv) Excluding extraordinary or irregular items;</li> <li>v) Excluding income derived from insurance.</li> </ul>
